

Did you know...

Almost everyone is a carrier for some genetic condition.

It's true. Most people test positive for a genetic condition. It's only on the rare occasion that your partner tests positive for the same condition that there's a problem.

- Both you and your partner need to be carriers of the same condition to pass on the disease to your child.
- Carrier couples have a 1 in 4 chance in each pregnancy of passing the disease on to the child.
- Thanks to medical advances, there are options for helping these couples have a healthy child.

Put the odds on your side. Finding out your carrier status can give you peace of mind and help you plan a healthy family.

Visit GeneTestNow.com for more information on genetic diseases among Jews and the general population. It's a valuable resource for all your questions, along with information about how and where you can get screened. Or call toll-free at 1-844-GENE-TEST. Get the knowledge you need to put the odds on your side.

Save \$100 on a genetic screening kit from JScreen.
