

Did you know...

Interfaith couples also need carrier screening.

Just because one of you is Jewish and the other isn't doesn't mean you can't pass on genetic diseases to your children.

- Sometimes certain conditions are more common in certain populations; however this does not mean that these same diseases don't exist across ethnic groups.

- There are a number of conditions that are more common in individuals of Jewish ancestry, but we can see these same diseases in other communities as well. For this reason, carrier screening is important for all couples, regardless of the ethnicities of the partners.

- A simple blood or saliva test can screen for more than 200 diseases, which includes conditions that are more common in the Jewish community as well as across ethnic groups.

Visit GeneTestNow.com for more information on genetic diseases among Jews and the general population. It's a valuable resource for all your questions, along with information about how and where you can get screened. Or call toll-free at 1-844-GENE-TEST. Get the knowledge you need to put the odds on your side.

Save \$100 on a genetic screening kit from JScreen.
